

ABSTRACT

An earring including a first device for attaching the earring to a pierced ear, and a second device for attaching the earring to an ear, which has not been pierced, are provided. The first device may be comprised of a clasp. The second device may be comprised of a pin. The clasp may snap shut tightly to hold the earring onto an ear. The earring may be further comprised of a body portion. The first device and the second device may be attached at opposite ends of the body portion so that the first device and the second device can rotate with respect to the body portion.
